

Soft Seating SnugSack

How to assemble SnugSack

1. Your SnugSack will arrive in a large cardboard box with cover and liner (filled with foam) separately. Liner will be contained in a vacuum sealed bag.
2. Remove the cover and liner from the box. Remove the liner from the vacuum sealed bag.
3. Make sure to keep the liner closed while you break apart the large chunks of foam. This will get oxygen to the foam which helps the foam expand back to its original shape. (The foam is already shredded so you don't need to manually rip the foam apart but simply release it from its compressed state).
4. Massage the foam to ensure all large chunks are completely broken apart. Take your designer cover and match the seams of the cover and the liner and enjoy! It will take a minimum of two weeks for your Comfy Sack to expand to its full size.

Important Note about our Liners:

Both inner liners and covers have locking zippers that are used for safety reasons. If you would like to open the liner to access the foam, simply insert a paper clip into the zipper to disengage the safety locking mechanism. The liner zipper can always move forward (to close the liner) but in order to open the liner you must have the zipper disengaged using a paper clip.

Comfy Tip?

Many customers have found it very helpful to simply remove the liner filled with foam from the box and let it sit for a full day without breaking up the foam. This allows the foam some time to start the expansion process on its own, so that you don't have to do all the work! Depending on how long the foam has been compressed, the foam may need some help to get the expansion process started. To expedite the expansion process, make sure the foam is broken down into golf ball size pieces and for the first week rotate and fluff once or twice a day. While this process may sound complicated, it is both fun and not difficult to do.
